ELNA 9900 V.1.40

The Elna 9900 V.1.40 program update contains new features and improvements:

Important notice:
Please update all Elna 9900 if you have more than one machine. Designs created in V.1.40 may cause some inconvenience when used in earlier versions of the Elna 9900.

Shortens the time for recognizing a USB memory key.

Resolves design issues with more than 50 jump thread codes.

Enhanced average speed :

o Average 10% - 30% improved working time.

Same color combine:

o You can group parts of assorted colors to reduce the number of layers of colors when you reproduce the patterns. If a color is defined by the user, the pattern can not be combined. A maximum of 200 layers is available.

Resolves jump thread trimming:

o Numbers of jumps are now recognizing correctly the number of programmed thread jump commands in order to differentiate between a jump and a trim in a manner common to commercial embroidery.
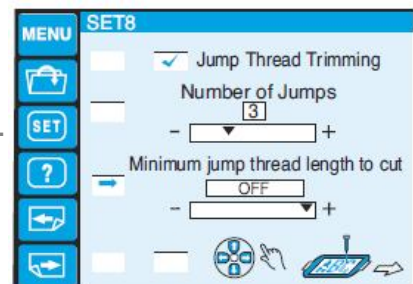

You can set the number of jumps that will launch the thread cut. The machine will automatically cut the thread jump after the specified number of jump points.

Enhanced jump thread trimming:

o In addition to a jump thread trim function based on minimum jump thread length has been added. Not only does this make jump thread trimming more convenient for non-commercial users, it improves jumps for designs digitized without commercial-style.

Press the button with the circle located next to + or - to set the minimum length of thread to cut. The machine will automatically cut the threads more than the length from the one selected.

Position adjustment while embroidering:

o Embroidery position can be adjusted with the jog keys even after starting to sew a design. This is a powerful feature for when embroidering multiple instances of the same design and needing perfectly precise alignment in the hoop, for instance when embroidering decorative buttonholes.

Stop this function in the ordinary sewing embroidery designs.
